تقديم

تعتبر وزارة الصناعة و التكنولوجيا المتقدمة (MOIAT) الجهة الوطنية المسؤولة عن أنشطة التقييس ؛ من خلال إصدار المواصفات القياسية الإماراتية / اللوائح الفنية من خلال اللجان الفنية المتخصصة.

أعدت الوزارة من خلال "اللجنة الفنية الوطنية لقطاع مواصفات الميكانيكا والمركبات اللائحة الفنية رقم " UAE.S 2698 : 2023 الخاصة بـ " المتطلبات الفنية للمركبات الكهربائية "

تمت الموافقة على هذا المعيار باعتباره لائحة فنية إماراتية بموجب قرار مجلس الوزراء الإماراتي رقم () بتاريخ x-x-2023

Electric Vehicles Technical Requirement

1. Scope

This standard is concerned to all electric vehicles with a speed of more than 25 km / h taking in consideration the compatibility with the relevant Gulf standards and regulations. The performance of the electrical vehicle is part of this regulation

2. Definitions

In implementing the provisions of this technical regulation, the following words and expressions shall have the meanings indicated opposite each of them, unless the context of the text indicates otherwise:

- 2.1 **Electrical Motor Vehicle:** An electric car is an alternative fuel automobile that uses electric motors and motor controllers for propulsion, in place of the internal combustion engine (ICE). EVs store electricity in an energy storage device, such as a battery, which must be replenished by plugging into an electrical source.
- 2.2 **Rechargeable Energy Storage System (REESS):** means the rechargeable energy storage system that provides electric energy for electric propulsion.
The REESS may include subsystem(s) together with the necessary ancillary systems for physical support, thermal management, electronic control.
- 2.3 **Electric power train:** means the electrical circuit which includes the traction motor(s), and may include the REESS, the electric energy conversion system, the electronic converters, the associated wiring harness and connectors, and the coupling system for charging the REESS.
- 2.4 **Electric Vehicle Charging System.** A system of components that is supplied to the vehicle for the purpose of recharging electric vehicle storage batteries.
- 2.5 **Electric Vehicle Connector.** A device that establishes an electrical connection to the electric vehicle for the purpose of power transfer and information exchange. This device is part of the electric vehicle coupler.
- 2.6 **Electric Vehicle Coupler.** A mating electric vehicle inlet and electric vehicle connector set.
- 2.7 **Electric Vehicle Inlet.** The device on the electric vehicle into which the electric vehicle connector is inserted for power transfer and information exchange.. For the purposes of this Code, the electric vehicle inlet is considered to be part of the electric vehicle and not part of the electric vehicle supply equipment.
- 2.8 **Electric Vehicle Storage Battery.** A battery, comprised of one or more rechargeable electrochemical cells that has no provision for the release of excessive gas pressure during normal charging and operation, or for the addition of water or electrolyte, or for external measurements of electrolyte specific gravity.
- 2.9 **Electric Vehicle Supply Equipment (EVSE).** The conductors, including the ungrounded, grounded, and equipment grounding conductors and the electric vehicle connectors, attachment plugs, and all other fittings, devices, power outlets, or apparatus installed specifically for the purpose of transferring energy between the premises wiring and the electric vehicle.

2.10 Electric Vehicle Supply Equipment System. A system of components that supplied to the vehicle for providing input power to an on-board charger.

2.11 Personnel Protection System. A system of personnel protection devices provide protection against electric shock of personnel.

3. **Electric vehicle requirements**

3.1 **General requirements on protection against electrical chock**

These requirements shall reduce deaths and injuries during a crash, during electric shock, which occur because of electrolyte spillage from propulsion batteries, intrusion of propulsion battery system components into the occupant compartment and electric shock.

3.1.1 Protection against direct contact

- Live parts, such as solid insulator, barrier, enclosure, etc ... shall not be able to be opened, disassembled or removed without the use of tools which can be done only by a competent person.
- Connectors shall locate under the floor and are provided with a locking mechanism. Or provided with a locking mechanism and other components shall be removed with the use of tools in order to separate the connector.
- The voltage of the live parts becomes equal or below DC 60V or below AC 30V (rms) within 1 second after the connector is separated.

3.1.2 Protection against indirect contact:

- The exposed conductive parts, such as the conductive barrier and enclosure, shall be galvanic ally connected securely to the electrical chassis, so that no dangerous potentials are produced.
- The resistance between all exposed conductive parts and the electrical chassis shall be less than 0.1ohm when there is current flow of at least 0.2 A .

3.1.3 Isolation resistance

Mechanically robust protections that have sufficient durability over vehicle service life such as motor housings, electronic converter cases or connectors shall be provided.

3.1.4

3.1.5 Rechargeable energy storage system (REESS)

- The REESS shall not overheat.
- It shall be equipped with a protective device such as fuses, circuit breakers or main contactors.
- Battery that may produce hydrogen gas shall be provided with a ventilation fan or a ventilation duct to prevent the accumulation of hydrogen gas.

For detailed requirements on the electrical safety requirements refer to UNECE 100

3.2 **Impact Strength**

3.2.1 **Frontal Impact**

This requirement specifies the limit of the rearward displacement of the steering to reduce the likelihood of chest, neck or head injuries. The body injuries are measured by using dummies with electrical impulse connections and measuring instruments. The electrical protection and electrolyte spillage are also measured.

3.2.1.1 Mechanical protection:

After the frontal impact:

- The part of the steering control surface directed towards the driver shall not present any rough edges likely to increase the danger or severity of injuries to the driver. The steering displacement shall be less than 127mm.
- No rigid component in the passenger compartment shall constitute a risk of serious injury to the occupants.
- The side doors of the vehicle shall not open under the effect of the impact to prevent occupant thrown out during an impact.
- The opening of doors to enable all the passengers to emerge shall be possible without the use of tools.
- The dummy performance criteria shall be complied to indicate that the occupants will not receive any serious injuries.

For detailed requirements on the electrical safety requirements refer to UNECE 94

3.2.1.2 Electrical Protection

The following conditions shall be complied to avoid any electric shock:

3.2.1.2.1 Protection against Electrical Shock

As a result of impact one of the two conditions indicated in items below shall be complied to avoid any electric shock:

- The voltages between high voltage buses shall be low as possible. The voltages V_b, V_1 and V_2 of the high voltage buses shall be equal or less than 30VAC or 60 VDC .The voltage measurement shall be made no earlier than 5 second, but, not later than 60 seconds after the impact.
- The total energy on the high voltage buses shall be low as possible. The total energy (TE) on the high voltage buses shall be less than 2.0 Joules.

3.2.1.2.2 Physical protection

- The resistance between all exposed conductive parts and the electrical chassis shall be low as possible, lower than 0.1ohm when there is a current flow of at least 0.2 A.
- For protection against direct contact with high voltage live parts the protection IPXXB shall be provided.

3.2.1.2.3 Isolation resistance

The isolation resistance between the high voltage bus and the electrical chassis shall have a minimum value of 100 Ω /volt of the working voltage for DC buses, and a minimum value of 500 Ω /volt of the working voltage for AC buses.

3.2.1.3 Electrolyte spillage

As a result of impact there shall no electrolyte leakage or should be a minimum amount specified (less than 7%) to avoid fire or electric shock and to reduce deaths and injuries. In the period from the impact until 30 minutes after no electrolyte from the REES shall spill into the passenger compartment and no more than 7% of electrolyte shall spill from the REESS except open type traction batteries outside the passenger compartment

3.2.1.4 RESS retention

As a result of impact the REESS (Electrical Power Train) shall not enter the passenger compartment during or after the impact.

For detailed requirements on the electrical safety requirements refer to UNECE 100

3.2.2 Rear Impact

This requirement specifies the limit of the inward displacement of the passenger compartment to reduce the likelihood of death and injuries. Its purpose is to protect passengers from the risk of fire or toxic or any electrical shock as a result of electrolyte spillage inside the passenger compartment during and after motor vehicle crashes.

3.2.2.1 Mechanical effect

After the rear impact on the vehicle the following shall be met:

- The longitudinal displacement of the vertical projection of the floor shall not cause any injury to the passengers. The rear displacement should be less than 75mm
- The side doors of the vehicle shall not open under the effect of the impact to prevent occupant thrown out during any impact
- The opening of doors to enable all the passengers to emerge shall be possible without the use of tools.

3.2.3 Side Impact

This requirement is to protect the occupants in side impact crashes. The purpose of this regulation is to reduce the risk of serious and fatal injury to the passenger in case of accidents. It also covers the requirements to avoid electrical shock.

3.2.3.1 Static side Impact

- The side doors shall be reinforced to reduce the impact forces from the side and to reduce the injuries or deaths due to side impact.
- The strength of the body structure and doors shall be such when tested the vehicle in accordance with Gulf standard the vehicle shall meet the following requirement to indicate the structure is strong enough to absorb the forces applied on them:
 - The initial crush resistance be more than 1020 kg.
 - The intermediate crush resistance be more than 1590 kg
 - The peak crush resistance be more than twice the curb weight of the vehicle or 3175 kg whichever is less.

3.2.3.2 Dynamic side Impact

- After the impact, the side doors should be strong enough that the passengers will not receive any serious injuries in a side impact with other vehicles or rollover accidents. The body injuries are measured by using dummies with electrical impulse connections and measuring instruments.

- At the end of specified impact no rigid component in the passenger compartment shall constitute a risk of serious injury to the passengers.
- The side doors of the vehicle which are not impacted shall not open under the effect of the impact, and the latches shall not separate from the striker to prevent passenger thrown out during an accident.
- After the side impact the conditions indicated in item 3/2/1/2 shall be complied to avoid electric shock.

3.2.3.3 Roof Strength

This requirement establishes strength requirement for the passenger compartment roof to reduce deaths and injuries due to crushing of the roof into the passenger compartment in rollover crashes. The maximum displacement of any vehicle less than 2722kg after the impact the roof of vehicle shall not exceed 127 mm when tested according to GSO regulation .

For detailed requirements on the safety requirements refer to GSO standards and standards in annex 1 .

3.3 Protection against water effects.

3.3.1 The regerminates

The vehicles shall maintain isolation resistance after exposure to water (e.g. washing, driving through standing water). This paragraph shall not apply to electrical circuits that are galvanically connected to each other, where the DC part of these circuits is connected to the electrical chassis .

The vehicle manufacturer shall follow the test procedures specified in Annex3, just after each exposure, and with the vehicle still wet, the resistance shall be less than 0.1Ω . In addition, after a 24-hour pause, the isolation resistance test shall again be performed, and the isolation resistance requirements shall be met.

3.3.2 Test procedure

3.3.2.1 Washing.

This test is intended to simulate the normal washing of vehicles, but not specific cleaning using high water pressure or underbody washing.

The areas of the vehicle regarding this test are border lines, i.e. a seal of two parts such as flaps, glass seals, outline of opening parts, outline of front grille and seals of lamps.

All border lines shall be exposed and followed in all directions with the water stream using a hose nozzle and conditions in accordance with IPX5 as specified in Annex 3.

3.3.2.2. Driving through standing water.

The vehicle shall be driven in a wade pool, with 10 cm water depth, over a distance of 500 m at a speed of 20 km/h, in a time of approximately 1.5 min.

If the wade pool used is less than 500 m in length, then the vehicle shall be driven through it several times. The total time, including the periods outside the wade pool, shall be less than 10 min.

3.4 Vibration test.

The test shall be conducted in accordance the below procedures:

During the test, there shall be no evidence of electrolyte leakage, rupture (applicable to high voltage REESS only), venting (for REESS other than open-type traction battery), fire or explosion. The evidence of electrolyte leakage shall be verified by visual inspection. For a high voltage REESS, the isolation resistance measured after the test shall not be less than 100 Ω/V .

3.4.1 Purpose.

The purpose of this test is to verify the safety performance of the REESS under a vibration environment which the REESS will likely experience during the normal operation of the vehicle

3.4.2 Installations.

This test shall be conducted either with the complete REESS or with REESS subsystem(s). If the manufacturer chooses to test with subsystem(s), the manufacturer shall demonstrate that the test result can reasonably represent the performance of the complete REESS with respect to its safety performance under the same conditions. If the electronic management unit for the REESS is not integrated in the casing enclosing the cells, then the electronic management unit may be omitted from installation on the Tested-Device if so requested by the manufacturer.

3.4.3 Procedure for conducting a standard cycle.

Procedure for conducting a standard cycle for a complete REESS, REESS subsystem(s), or complete vehicle.

3.4.3.1 Standard discharge:

Discharge rate: The discharge procedure including termination criteria shall be defined by the manufacturer. If not specified, then it shall be a discharge with 1C current for a complete REESS and REESS subsystems.

Discharge limit (end voltage): Specified by the manufacturer.

For a complete vehicle, discharge procedure using a dynamometer shall be defined by the manufacturer. Discharge termination will be according to vehicle controls.

Rest period after discharge: minimum 15 min

3.4.3.2 Standard charge:

The charge procedure shall be defined by the manufacturer. If not specified, then it shall be a charge with C/3 current. Charging is continued until normally terminated.

For a complete vehicle that can be charged by an external source, charge procedure using an external electric power supply shall be defined by the manufacturer. For a complete vehicle that can be charged by on-board energy sources, a charge procedure using a dynamometer shall be defined by the manufacturer. Charge termination will be according to vehicle controls.

3.4.4 Test procedure:

The Tested-Device shall be subjected to a vibration having a sinusoidal waveform with a logarithmic sweep between 7 Hz and 50 Hz and back to 7 Hz traversed in 15

minutes. This cycle shall be repeated 12 times for a total of 3 hours in the vertical direction of the mounting orientation of the REESS as specified by the manufacturer.

The correlation between frequency and acceleration shall be as shown in following table:

Frequency and acceleration

Frequency (Hz)	Acceleration (m/s ²)
7 - 18	10
18 - 30	gradually reduced from 10 to 2
30 - 50	2

- At the request of the manufacturer, a higher acceleration level as well as a higher maximum frequency may be used.
- At the choice of the manufacturer, a vibration test profile determined by the vehicle manufacturer verified for the vehicle application may be used as a substitute for the frequency - acceleration correlation of above table.
- The REESS certified according to this condition shall be limited to the installation for a specific vehicle type.
- After the vibration profile, a standard cycle as described in paragraph 3.4.3. shall be conducted,
- The test shall end with an observation period of 1 hour at the ambient temperature conditions of the test environment.

4. Performance of the electrical vehicles

4.1 Electrical performance

- The Technical Service in charge of the tests conducts the measurement of the electric energy consumption according to the method and test cycle described in UNECER 101 -Annex 7 to this Regulation.
- The Technical Service in charge of the tests conducts the measurement of the electric range of the vehicle according to this Regulation. The electric range measured by this regulation is the only one which may be included in sales promotional material. This value must also be used for the calculations
- The result of the electric energy consumption must be expressed in Watt hours per kilometer (Wh/km) and the range in km, both rounded to the nearest whole number.
- If the measured value of electric energy exceeds the manufacturer's declared electric energy value by more than 4 %, then another test is run on the same vehicle. When the average of the two test results does not exceed the manufacturer's declared value by more than 4 %, then the value declared by the manufacturer is taken as the type approval value.
- If the average still exceeds the declared value by more than 4 %, a final test is run on the same vehicle. The average of the three test results is taken as the type approval value.
- The electric range value adopted as the type approval value shall be the value declared by the manufacturer if this is no more than the value measured by the Technical Service. The declared value may be lower than the measured value without any limitations.
- If the declared range value exceeds the value measured by the Technical Service, then another test is run on the same vehicle. When the manufacturer declared value does not exceed the average of the two test results, then the value declared by the manufacturer is taken as the type approval value.

- If the declared value still exceeds the average measured value a final test is run on the same vehicle. The average of the three results is taken as the type approval value.

4.2 Test conditions

4.2.1. Condition of the vehicle

- The vehicle tyres shall be inflated to the pressure specified by the vehicle manufacturer when the tyres are at the ambient temperature.
- The lighting and light-signaling and auxiliary devices shall be off, except those required for testing and usual daytime operation of the vehicle.
- All energy storage systems available for other than traction purposes (electric, hydraulic, pneumatic, etc.) shall be charged up to their maximum level specified by the manufacturer.
- If the batteries are operated above the ambient temperature, the operator shall follow the procedure recommended by the vehicle manufacturer in order to keep the temperature of the battery in the normal operating range.
- The manufacturer's agent shall be in a position to attest that the thermal management system of the battery is neither disabled nor reduced.
- The vehicle must have undergone at least 300 km during the seven days before the test with those batteries that are installed in the test vehicle.

4.3 Test methods

The electrical range should be test according to ISO 8714 and the same test sequence in annex A in ISO 8714 shall be used to define energy consumption and range.

4.4 Electric energy consumption, C

All cars should be equipped with the electrical car performance label. The performance values must be specified at the standard conditions based on a declaration and on the responsibility of the manufacturer.

The energy consumption C is the Energy required to travel D km in standardized conditions, shall be calculated using the formula:

$$C = \frac{E}{D}$$

Expressed in watt-hours per kilometer (Wh/km), rounded to the nearest whole number.

E: Energy in Wh

D : test is the distance covered during the test (km).

Electric energy consumption (Wh / Km) shall be not more than 300 Wh/ Km .

4.5 Total Range:

The maximum distance an electrified vehicle can travel using battery power over a designated test sequence on a fully charged traction battery, to the end of the test sequence expressed in kilometers (km). It should be at least 200 KM it should be specified and declared from manufactures

5. Manufacture Responsibility

- 5.1 The manufacturers should carryout type test for all the requirements of this regulation.
- 5.2 Each manufacturer shall prepare manual with risks and all the warnings for safe use for electrical cars.
- 5.3 Warning shall be written in case of any accident with following meaning:
- A damaged 400 V circuit components or cable may cause burns or electrocution so do not touch damaged orange 400 V cables or the 400 V components.
 - If the traction battery is damaged, there may be a delayed risk of fire. In this Case, it is necessary to place the vehicle or the damaged battery under surveillance in a dedicated and secure storage area so as to prevent the start of a fire
 - The manufacturers and dealers shall provide proper training to civil defense departments On response and proved them with :
 - a- procedure for a vehicle involved in an impact whilst charging
 - b- Procedure for a vehicle on fire and should include:
 - Hazards and protective equipment to be use.
 - Action procedure to extinguish the vehicle.
 - c- Instructions for avoid high voltage area and Instructions for freeing vehicle occupants
 - Prohibited cutting areas
 - Recommended cutting areas
 - d - Procedure in the event of an electrolyte leak from the traction battery.
- 5.4 The manufacturers or his dealer should have at least one workshop with all qualified and trainer persons for regular maintenance and repairing there vehicles.
- 5.5 All cars should be equipped with the electrical car performance label, It must be non-removable and placed at area can be easily seen.
- 5.6 Training the buyer on the correct and safe way to use these vehicles, how to maintain them, how to charge their batteries, etc

6. Electric Vehicle Charging and Supply Equipment Systems

6.1 Equipment Construction

6.1.1 Electric Vehicle Coupler:

The electric vehicle coupler shall comply with:

- The electric vehicle coupler shall have a configuration that is non-interchangeable with wiring devices in other electrical systems. Non-grounding-type electric vehicle couplers shall not be interchangeable with grounding-type electric vehicle couplers.
- The electric vehicle coupler shall be constructed and installed so as to guard against inadvertent contact by persons with parts made live from the electric vehicle supply equipment or the electric vehicle battery.
- The electric vehicle coupler shall be provided with a positive means to prevent unintentional disconnection.
- If a grounding pole is provided, the electric vehicle coupler shall be so designed that the grounding pole connection is the first to make and the last to break contact.

6.1.2 Power Rating:

Electric vehicle supply equipment shall have sufficient rating to supply the load served . Where an automatic load management system is used, the maximum electric vehicle supply equipment load on a service or feeder shall be the maximum load permitted by the automatic load management system.

6.1.3 Markings:

- All electric vehicle supply equipment shall be marked by the manufacturer as follows:
“FOR USE WITH ELECTRIC VEHICLES “
- The electric vehicle supply equipment shall be clearly marked if ventilation not required by the manufacturer as follows:
“Ventilation not required “
- The electric vehicle supply equipment shall be clearly marked by the manufacturer,
“Ventilation Required.”

The marking shall be located so as to be clearly visible after installation.

6.1.4 Cords and Cables:

The cable for cord-connected equipment shall comply with all of the following:

- The overall useable length shall not exceed 7.5 m unless equipped with a cable management system that is part of a listed the electric vehicle supply equipment or electric vehicle charging system.
- Where the electric vehicle supply equipment or charging system is not fixed in place, the cord exposed useable length shall be measured from the face of the attachment plug to the face of the electric vehicle connector.
- Where the electric vehicle supply equipment or charging system is fixed in place, the useable length of the output cable shall be measured from the cable exit of the electric vehicle supply equipment or charging system to the face of the electric vehicle connector.

Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and composite optical fiber cables, shall be permitted.

6.1.5 Interlock.

Electric vehicle supply equipment shall be provided with an interlock that de-energizes the electric vehicle connector and its cable whenever the electrical connector is uncoupled from the electric vehicle.

6.1.6 Automatic De-Energization of Cable.

The electric vehicle supply equipment or the cable-connector combination of the equipment shall be provided with an automatic means to de-energize the cable conductors and electric vehicle connector upon exposure to strain that could result in either cable rupture or separation of the cable from the electric connector and exposure of live parts.

6.1.7 Personnel Protection System (Emergency disconnected devices)

The electric vehicle supply equipment shall have a listed system of protection against electric shock of personnel.

6.2 Installation

6.2.1 Branch Circuit Markings.

When a branch circuit is installed to supply electric vehicle supply equipment (or electric vehicle charging system), a label shall be permanently affixed adjacent to the outlet box and shall contain the following information:

“For use with electric vehicle supply equipment (or) electric vehicle charging system”,
In addition to showing the appropriate voltage and current data for use

6.2.2 Overcurrent Protection.

Overcurrent protection for feeders and branch circuits supplying electric vehicle supply equipment shall be sized for continuous duty and shall have a rating of not less than 125 percent of the maximum load of the electric vehicle supply equipment. Where non-continuous loads are supplied from the same feeder or branch circuit, the overcurrent device shall have a rating of not less than the sum of the non-continuous loads plus 125 percent of the continuous loads.

6.2.3 Electric Vehicle Supply Equipment Connection.

Electric vehicle supply equipment shall be permitted to be cord and plug connected to the premises wiring system in accordance with one of the following:

- Electric vehicle supply equipment that is rated 250 volts maximum and complies with all of the following:
 - It is intended for connection to receptacle outlets rated no more than 50 amperes.
 - It is installed to facilitate any of the following:
 - a. Facilitate maintenance and repair
 - b. Repositioning of Portable, movable, or EVSE fastened in place
 - The length of the power supply cord for electric vehicle supply equipment fastened in place is limited to (1.8 m).
 - Receptacles are located to avoid physical damage to the flexible cord.
 - All other electric vehicle supply equipment shall be permanently connected to the premises wiring system.

7. Spare Tire

Electric vehicles equipped with a repair kit are exempted from the requirement to provide the vehicle with a spare tire, which is mentioned in the Gulf Technical Regulation No. GSO 42.

Annex 1

GSO Standards / Technical Regulation for Electrical Motor Vehicles

No.	GSO Standard	Arabic Title	English Title
1	GSO 36	السيارات - طرق اختبار تحمل الصدمات - الجزء الأول : الصدمة الأمامية	motor vehicles – methods of test for impact strength - Part 1 : frontal impact

Annex 2

1. Workstation for EV

1.1 Protection against electrical hazards in the working area

Before undertaking any operation on an electrical installation, an electrical risk assessment must be carried out to identify and prevent electrical hazards during an operation or when using an electrical vehicle in the workstation.

This assessment must specify how the operation is to be carried out and what measures and precautions need to be taken to ensure safety.

1.2 Staff Training requirements

- All staff involved in the operations on or near to an electrical installation must be trained in the safety requirements, safety rules and in-house instructions applicable to the operation.
- The goal of the training and education for the staff in the workshop is to:
 - a. Learn about the dangers associated with electricity and be able to identify the hazards.
 - b. Learn about the preventive actions and know how to apply them.
 - c. Educate Customers on the use and ownership of an Electric Vehicle
- Staff must wear clothes appropriate to the workstation and conditions in which they are required to work. This may include the use of snugly fitted clothing or additional personal protective equipment (PPE)

1.3 Staff responsibility in the workshop:

We can classify the staff in the workshop to :

1.3.1 Qualified person

Trained person with relevant knowledge and experience to analyze electrical risks and avoid the hazards electricity could bring about. He could be Battery Specialist or EV Technician. He can do all type of maintenance and repairing.

1.3.2 Informed person

Person sufficiently informed so as to avoid the dangers that electricity could bring about, Could be body or Mechanical Technician, Service or body shop Manager. He can make all type of maintenance and repairing except electrical and battery repairing.

1.3.3 Ordinary person

Untrained Person who is neither qualified, nor an informed person. He could be sales executive, or service advisor he cannot do any type of maintenance and repairing.

All the workshops for repairing or do a service for electrical vehicles should have at least one qualified person.

2. Safety Equipment for EV Workstation

- Clear instructor to use the lock out system before working on the High Voltage System and moving Accident Damaged Vehicles.

- Employer is responsible for Providing and maintaining PPE for all staff .
- It is compulsory for the staff to wear individual protection equipment during any operation in the orange zone (Battery removal, Lockout)
- The workstation should have a collective protection equipment (CPE) for :
 - Battery Repair area
 - Vehicle Protected Area
 - Insulation
- The workstation should have a workspace for high voltage system repairs at it should have a warning Panel the meaning of :
“Dangers area, high voltage working area”

3. **Handling a vehicle involve in an accident:**

The vehicle must be locked out prior to any repair, with an open space for parking the electric vehicle and 5 meters of empty spaces around the electric vehicle. In the event of damage to the structure, battery, or any high-voltage wires, a qualified person must assess the integrity of the following components:

- Exposed Components
- Leaking Fluids
- Damaged Battery / Wiring
- Vehicle Locked Out

If any of above it should be putting in isolated area.

Annex 3

Verification method for testing authorities confirming document-based isolation resistance compliance of electrical design of the vehicle after water exposure.

This annex describes the applicable requirements when certifying the manufacturers' high voltage equipment or system components against adverse water effects rather than a physical test. Vehicle manufacturers shall provide information to testing authorities to identify, as a point of reference, the mounting location for each high-voltage component in/on the vehicle.

1. Documentation shall contain the following information:

(a) on how the manufacturer tested isolation resistance compliance of electrical design of the vehicle by using fresh water;

(b) on how, after the test had been carried out, the high-voltage component or system was inspected for ingress of water and how, depending on its mounting location, each high voltage component/system met the appropriate degree of protection against water.

2. The testing authority will verify and confirm the authenticity of documented conditions that have been observed, and should have been complied with, during the process of certification by manufacturer:

2.1. It is permitted that, during the test, the moisture contained inside the enclosure is partly condensed. The dew which may be deposited is not considered as ingress of water. For the purpose of the tests, the surface area of the tested high-voltage component or system is calculated with an accuracy of 10 per cent. If possible, the tested high-voltage component or system is run energized. If the tested high-voltage component or system is energized, adequate safety precautions are taken.

2.2. For electrical components, externally attached (e.g. in engine compartment), open underneath, both exposed or protected locations, the testing authority shall verify, with a view to confirming the compliance, whether the test is conducted by spraying the high-voltage component or system from all practicable directions with a stream of water from a standard test nozzle as shown in Figure 1. The following parameters are observed during the test in particular:

(a) Nozzle internal diameter: 6.3 mm;

(b) Delivery rate: 11.9 – 13.2 l/min;

- (c) Water pressure at the nozzle: approximately 30 kPa (0.3 bar);
- (d) Test duration per m² of surface area of the tested high-voltage component or system: 1 min;
- (e) Minimum test duration: 3 min;
- (f) Distance from nozzle to tested high-voltage component or system surface: approximately 3 m (this distance may be reduced, if necessary to ensure proper wetting when spraying upwards).

Figure 1- **Standard nozzle for the test**

Dimensions in millimeters D is 6.3 mm as specified in (a) above.

2.3. For electrical components, externally attached (e.g. in engine compartment), covered from underneath, the testing authority shall verify, with a view to confirming the compliance, whether:

- (a) The cover protects the component against direct spray water from underneath and is not visible;
- (b) The test is conducted by using splashing test nozzle as shown in Figure 2;
- (c) The moving shield is removed from the spray nozzle and the machine is sprayed from all practicable directions;
- (d) The water pressure is adjusted to give a delivery rate of (10 ± 0.5) l/min (pressure approximately 80 kPa to 100 kPa (0.8 bar to 1.0 bar));
- (e) The test duration is 1 min/m² of calculated surface area of the machine (excluding any mounting surface and cooling fin) with a minimum duration of 5 min.

Figure 2 - Splashing test nozzle

Machine under test |
|---|---|

3. The entire high voltage system or each component is checked to comply with the isolation resistance requirement with the following conditions:

- (a) The electric chassis shall be simulated by an electric conductor, e.g. a metal plate, and the components are attached with their standard mounting devices to it;
- (b) Cables, where provided, shall be connected to the component.
